(54) Title: PYRAZOLE DERIVATIVES

(57) Abstract: This invention relates to pyrazole derivatives of formula (I) or pharmaceutically acceptable salts, solvates or derivative thereof, wherein R<sup>1</sup> to R<sup>4</sup>, n, W, X and Y are defined in the description, and to processes for the preparation thereof, intermediates used in their preparation of, compositions containing them and the uses of such derivatives. The compounds of the present invention bind to the enzyme reverse transcriptase and are modulators, especially inhibitors thereof. As such the compounds of the present invention are useful in the treatment of a variety of disorders including those in which the inhibition of reverse transcriptase is implicated.

Disorders of interest include those caused by Human Immunodeficiency Virus (HIV) and genetically related retroviruses, such as Acquired Immune Deficiency Syndrome (AIDS).

WO 2004/031178 A1

Pyrazole Derivatives

This invention relates to pyrazole derivatives, to their use in medicine, to compositions containing them, to processes for their preparation and to intermediates used in such processes.

Reverse transcriptase is implicated in the infectious lifecycle of Human Immunodeficiency Virus (HIV). Compounds which interfere with the function of this enzyme have shown utility in the treatment of conditions caused by HIV and genetically related retroviruses, such as Acquired Immune Deficiency Syndrome (AIDS). There is a constant need to provide new and better modulators, especially inhibitors, of HIV reverse transcriptase, since the virus is able to mutate, becoming resistant to the effects of known modulators.

Antiviral activity is ascribed to a class of N(hydroxyethyl)pyrazole derivatives in US patent number 3,303,200. A number of pyrazoles are disclosed as reverse transcriptase inhibitors, including: a class of N-phenylpyrazoles (*J. Med. Chem.*, 2000, **43**, 1034); a class of C and S linked aryl pyrazoles (WO02/04424); and a class of O and S linked aryl pyrazoles, the O and S aryl link being adjacent to the nitrogen atom (WO02/30907).

According to the present invention there is provided a compound of formula (I)

or a pharmaceutically acceptable salt, solvate or derivative thereof, wherein:

10

The compounds of the invention may have advantages over those of the prior art with regard to a number of useful properties or combinations thereof, such as potency, duration of action, pharmacokinetics, spectrum of activity, side effect profile, solubility, chemical stability, and so on.

15

The compounds of the invention may be prepared by any method known in the art for the preparation of compounds of analogous structure. The compounds of the invention can be prepared by the procedures described in the methods below, or by the specific methods described in the Examples, or by similar  
20 methods to either. The invention also encompasses any one or more of these processes for preparing the compounds of the invention, in addition to any novel intermediates used therein.

25

In the following methods, W, X, Y, R<sup>1</sup> to R<sup>4</sup>, and n are as previously defined for a compound of formula (I), unless otherwise stated; Z is H or C<sub>1</sub>-C<sub>4</sub> alkoxy (e.g. methoxy); THF is tetrahydrofuran; DCM is dichloromethane; DMF is N,N-dimethylformamide and Ac is acyl.

30

Compounds of formula (I) may be prepared according to Scheme 1 that follows.

35

According to Scheme 1, compounds of formula (I) may be prepared by the reaction of a compound of formula (II) with an amine of formula (IV) under conventional conditions. For aldehydes of formula (II), i.e. wherein Z is H, reaction conditions are those of reductive amination/alkylation in the presence of a reducing agent. For esters of formula (II), i.e. wherein Z is C<sub>1</sub>-C<sub>4</sub> alkoxy (e.g. methoxy), reaction conditions are those of alkylation/condensation in the presence of a base.

Scheme 1

- 5 Conveniently, reductive amination/alkylation is effected using a hydride reducing agent, such as a borohydride (e.g. Na(OAc)<sub>3</sub>BH or NaCNBH<sub>3</sub>); optionally, an activating agent, such as acetic acid or sodium acetate; in the presence of a solvent, such as an ether (e.g. THF) or a haloalkane (e.g. DCM); and at ambient to elevated temperature, such as ambient temperature.

Conveniently, alkylation/condensation is effected using an alkali metal base, such as an alkali metal carbonate (e.g. sodium, potassium or caesium carbonate); in the presence of a solvent, such as a polar aprotic solvent (e.g. acetonitrile or DMF); and at ambient to elevated temperature, such as ambient temperature to 40°C.

Amines of formula (IV) may be prepared by reaction of the corresponding halide of formula (V) with a source of ammonia under conventional conditions. Conveniently the reaction is effected in the presence a solvent, such as an alcohol (e.g. ethanol or isopropanol), said solvent being saturated with ammonia; and at reduced to ambient to elevated temperature, such as reduced temperature (e.g. 0°C).

Compounds of formula (V) may be prepared by halogenation of a compound of formula (VI) using a source of halogen, such as a molecular halogen (e.g. bromine) or an N-halo-succinimide (e.g. N-bromo-succinimide), under conventional conditions. Conveniently the halogenation is effected in the presence of a solvent, such as a haloalkane (e.g. carbon tetrachloride or 1,1,1-trichloroethane); optionally a radical initiation catalyst, such as ultraviolet light or AIBN; and at ambient to elevated temperature, such as under reflux.

Compounds of formula (VI) may be prepared by the reaction of a compound of formula (VIII) with a hydrazine of formula (VII), or a salt or hydrate thereof. Conveniently, the reaction is effected a solvent, such as a protic solvent (e.g. acetic acid); at ambient to elevated temperature, such as ambient temperature; and optionally in the presence of an acid (e.g. acetic acid) or a base, such as a tertiary amine (e.g. triethylamine).

Compounds of formula (VIII) may be prepared by the reaction of a compound of formula (X) with an alcohol of formula (IX). Conveniently, the reaction is effected in the presence of a solvent, such as a polar solvent (e.g. acetone); a base, such as an inorganic base, preferably a metal carbonate (e.g. potassium or caesium carbonate); optionally, a nucleophilic catalyst, such as sodium iodide or tetrabutylammonium iodide; and at ambient to elevated temperature, such as elevated temperature (e.g. under reflux).

Ketoesters of formula (IX) are either commercially available, known in the literature, or may be prepared by conventional methods (e.g., where  $Lg^1$  is Cl, by

the chlorination of corresponding ketoesters, for instance using sulphonyl chloride).

Compounds of formula (I) may also be prepared by reaction of a compound of formula (III) with an amine of formula (IV) under conventional conditions. Conveniently, the reaction is effected in the presence of a reducing agent under conditions of reductive amination/alkylation, such as those described above for the preparation of a compound of formula (I) by reaction of a compound of formula (II) with an amine of formula (IV).

10

Compounds of formula (I) in which  $R^3$  is halo can be prepared from a compound of formula (XI)

under conventional conditions. Conveniently, the reaction is effected by an inorganic acid halide, such as an inorganic acid chloride (e.g.  $\text{POCl}_3$ ); optionally in the presence of a solvent, such as a polar aprotic solvent (e.g. N,N-dimethylformamide); and at reduced to ambient temperature, such as ambient temperature.

Compounds of formula (XI) may be prepared using the routes described above, *mutatis mutandis*.

It will be appreciated by those skilled in the art that, in many cases, compounds of formula (I) may be converted into other compounds of formula (I) by functional group transformations, including for example the following interconversions.

Compounds of formula (I) in which  $R^2$  is optionally substituted  $\text{C}_1\text{-C}_6$  alkyl may be prepared from compounds of formula (I) in which  $R^2$  is H by reaction with an alkylating agent. Suitable alkylating agents include bromoacetonitrile, ethyl 4-chloroacetoacetate, methyl bromoacetate and chloroethylamine hydrochloride. Conveniently, alkylation is effected in the presence of a suitable solvent, such as an alcohol (e.g. ethanol) or a polar aprotic solvent (e.g. N,N-dimethylformamide); a base, such as a metal hydride (e.g. sodium hydride) or metal alkoxide (e.g. sodium ethoxide); and at ambient to elevated temperature, such as under reflux.

Compounds of formula (I) in which  $R^2$  or  $R^3$  contains a hydroxy group may be prepared from the corresponding compound of formula (I) in which  $R^2$  or  $R^3$  contains an ester group by reduction. Conveniently, the reduction is effected by  
5 a metal hydride agent, such as lithium aluminium hydride; in a solvent, such as an ether (e.g. diethyl ether); and at reduced temperature, such as from  $-78^{\circ}\text{C}$  to  $0^{\circ}\text{C}$ .

Compounds of formula (I) in which  $R^2$  or  $R^3$  are substituted by a heterocycle of  
10 formula  $R^8$  and  $R^9$  may be prepared by standard heterocycle-forming reactions well known to the skilled man (see, for example, Advanced Organic Chemistry, 3rd Edition, by Gerry March or Comprehensive Heterocyclic Chemistry, A.R. Katritzky, C.W. Rees, E.F.V. Scriven, Volumes 1-11).

Compounds of formula (I) in which  $R^3$  is  $-\text{CO}_2\text{H}$  may be prepared by hydrolysis of  
15 a corresponding compound of formula (I) in which  $R^3$  is  $-\text{CO}_2\text{R}^5$ . Conveniently, the reaction is effected in the presence of a solvent, such as an alcohol (e.g. aqueous ethanol), or an ether (e.g. aqueous 1,4-dioxan); and in the presence of a base, such as a metal hydroxide (e.g. sodium hydroxide). The skilled artisan  
20 will appreciate that such an acid may be converted into a primary amide by reaction with ammonia and a suitable coupling agent, such as a carbodiimide, e.g. dicyclohexylcarbodiimide, and that such a primary amide may then be converted into a nitrile by dehydration with a suitable dehydrating agent, such as phosphoryl chloride.

25 Compounds of formula (I) in which  $R^3$  is  $\text{C}_1\text{-C}_6$  alkyl may be converted into the compounds of formula (I) in which  $R^3$  is  $\text{C}_1\text{-C}_6$  alkyl substituted by halo (such as bromo), by halogenation, using a suitable halogenating agent. Conveniently the reaction is effected in the presence of a solvent, such as a haloalkane (e.g.  
30 dichloromethane) and at ambient temperature. Suitable halogenating agents include halogens (e.g. bromine) or N-halosuccinimides (e.g. N-bromosuccinimide).

Compounds of formula (I) containing an  $-\text{OH}$ ,  $-\text{NH}-$  or  $-\text{NH}_2$  group may be prepared by the deprotection of the corresponding compound bearing an  $-\text{OP}^1$ ,  
35  $-\text{NP}^1$ - or  $-\text{NHP}^1$  group, respectively, wherein the group  $\text{P}^1$  is a suitable protecting group. Examples of suitable protecting groups will be apparent to the skilled person; see, for instance, 'Protecting groups in Organic Synthesis (Second Edition)' by Theodora W. Green and Peter G. M. Wuts, 1991, John Wiley and

Sons. Such compounds bearing an -OP<sup>1</sup>, -NP<sup>1</sup>- or -NHP<sup>1</sup> group may be prepared using the routes described above, *mutatis mutandis*.

5 Compounds of formulae (II), (III), (VII) and (IX) are either commercially available, known in the literature or easily prepared by methods well known to those skilled in the art, such as those described in the Preparations hereinafter.

10 The compounds of the invention can be administered alone, but will generally be administered in admixture with a suitable pharmaceutical excipient, diluent or carrier selected with regard to the intended route of administration and standard pharmaceutical practice.

15 For example, the compounds of the invention can be administered orally, buccally or sublingually in the form of tablets, capsules, multi-particulates, gels, films, ovules, elixirs, solutions or suspensions, which may contain flavouring or colouring agents, for immediate-, delayed-, modified-, sustained-, pulsed- or controlled-release applications. The compounds of the invention may also be administered as fast-dispersing or fast-dissolving dosage forms or in the form of a high energy dispersion or as coated particles. Suitable formulations of the  
20 compounds of the invention may be in coated or uncoated form, as desired.

Such solid pharmaceutical compositions, for example, tablets, may contain excipients such as microcrystalline cellulose, lactose, sodium citrate, calcium carbonate, dibasic calcium phosphate, glycine and starch (preferably corn, potato  
25 or tapioca starch), disintegrants such as sodium starch glycollate, croscarmellose sodium and certain complex silicates, and granulation binders such as polyvinylpyrrolidone, hydroxypropylmethylcellulose (HPMC), hydroxypropylcellulose (HPC), sucrose, gelatin and acacia. Additionally, lubricating agents such as magnesium stearate, stearic acid, glyceryl behenate and talc may be included.  
30

#### General Example

A formulation of the tablet could typically contain from 0.01mg to 500mg of active compound whilst tablet fill weights may range from 50mg to 1000mg. An  
35 example of a formulation for a 10mg tablet is illustrated below:

	<u>Ingredient</u>	<u>%w/w</u>
	Compound of the invention	10.000*
	Lactose	64.125
	Starch	21.375
5	Croscarmellose sodium	3.000
	Magnesium Stearate	1.500

\* Quantity adjusted in accordance with drug activity.

10 The tablets are manufactured by a standard process, for example, direct compression or a wet or dry granulation process. The tablet cores may be coated with appropriate overcoats.

15 Solid compositions of a similar type may also be employed as fillers in gelatin or HPMC capsules. Preferred excipients in this regard include lactose, starch, a cellulose, milk sugar or high molecular weight polyethylene glycols. For aqueous suspensions and/or elixirs, the compounds of the invention may be combined with various sweetening or flavouring agents, colouring matter or dyes, with emulsifying and/or suspending agents and with diluents such as water, ethanol, 20 propylene glycol and glycerin, and combinations thereof.

The compounds of the invention can also be administered parenterally, for example, intravenously, intra-arterially, intraperitoneally, intrathecally, intraventricularly, intraurethrally, intrasternally, intracranially, intramuscularly or 25 subcutaneously, or they may be administered by infusion or needleless injection techniques. For such parenteral administration they are best used in the form of a sterile aqueous solution which may contain other substances, for example, enough salts or glucose to make the solution isotonic with blood. The aqueous solutions should be suitably buffered (preferably to a pH of from 3 to 9), if 30 necessary. The preparation of suitable parenteral formulations under sterile conditions is readily accomplished by standard pharmaceutical techniques well-known to those skilled in the art.

35 For oral and parenteral administration to human patients, the daily dosage level of the compounds of the invention will usually be from 0.01 to 30 mg/kg, preferably from 0.01 to 5 mg/kg (in single or divided doses).

Thus tablets or capsules of the compound of the invention may contain from 1 to 500 mg of active compound for administration singly or two or more at a time, as

appropriate. The physician in any event will determine the actual dosage which will be most suitable for any individual patient and it will vary with the age, weight and response of the particular patient. The above dosages are exemplary of the average case. There can, of course, be individual instances where higher or lower dosage ranges are merited and such are within the scope of this invention. The skilled person will appreciate that, in the treatment of certain conditions the compounds of the invention may be taken as a single dose as needed or desired.

The compounds of invention can also be administered intranasally or by inhalation and are conveniently delivered in the form of a dry powder inhaler or an aerosol spray presentation from a pressurised container, pump, spray, atomiser or nebuliser, with or without the use of a suitable propellant, e.g. dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane, a hydrofluoroalkane such as 1,1,1,2-tetrafluoroethane (HFA 134A [trade mark]) or 1,1,1,2,3,3,3-heptafluoropropane (HFA 227EA [trade mark]), carbon dioxide or other suitable gas. In the case of a pressurised aerosol, the dosage unit may be determined by providing a valve to deliver a metered amount. The pressurised container, pump, spray, atomiser or nebuliser may contain a solution or suspension of the active compound, e.g. using a mixture of ethanol and the propellant as the solvent, which may additionally contain a lubricant, e.g. sorbitan trioleate. Capsules and cartridges (made, for example, from gelatin) for use in an inhaler or insufflator may be formulated to contain a powder mix of a compound of the invention and a suitable powder base such as lactose or starch.

Alternatively, the compounds of the invention can be administered in the form of a suppository or pessary, or they may be applied topically in the form of a gel, hydrogel, lotion, solution, cream, ointment or dusting powder. The compounds of the invention may also be dermally or transdermally administered, for example, by the use of a skin patch. They may also be administered by the pulmonary or rectal routes.

They may also be administered by the ocular route. For ophthalmic use, the compounds can be formulated as micronised suspensions in isotonic, pH adjusted, sterile saline, or, preferably, as solutions in isotonic, pH adjusted, sterile saline, optionally in combination with a preservative such as a benzylalkonium chloride. Alternatively, they may be formulated in an ointment such as petrolatum.

For application topically to the skin, the compounds of the invention can be formulated as a suitable ointment containing the active compound suspended or dissolved in, for example, a mixture with one or more of the following: mineral oil, liquid petrolatum, white petrolatum, propylene glycol, polyoxyethylene polyoxypropylene compound, emulsifying wax and water. Alternatively, they can be formulated as a suitable lotion or cream, suspended or dissolved in, for example, a mixture of one or more of the following: mineral oil, sorbitan monostearate, a polyethylene glycol, liquid paraffin, polysorbate 60, cetyl esters wax, cetearyl alcohol, 2-octyldodecanol, benzyl alcohol and water.

The compounds of the invention may also be used in combination with a cyclodextrin. Cyclodextrins are known to form inclusion and non-inclusion complexes with drug molecules. Formation of a drug-cyclodextrin complex may modify the solubility, dissolution rate, bioavailability and/or stability property of a drug molecule. Drug-cyclodextrin complexes are generally useful for most dosage forms and administration routes. As an alternative to direct complexation with the drug the cyclodextrin may be used as an auxiliary additive, e.g. as a carrier, diluent or solubiliser. Alpha-, beta- and gamma-cyclodextrins are most commonly used and suitable examples are described in WO91/11172, WO94/02518 and WO98/55148.

It is to be appreciated that all references herein to treatment include curative, palliative and prophylactic treatment.

Oral administration is preferred.

Included within the scope of the invention are embodiments comprising the co-administration of a compound of the invention with one or more additional therapeutic agents, and compositions containing a compound of the invention along with one or more additional therapeutic agents. Such a combination therapy is especially useful for the prevention and/or treatment of infection by HIV and related retroviruses which may evolve rapidly into strains resistant to any monotherapy. Alternatively, additional therapeutic agents may be desirable to treat diseases and conditions which result from or accompany the disease being treated with the compound of the invention. For example, in the treatment of an HIV or related retroviral infection, it may be desirable to additionally treat opportunistic infections, neoplasms and other conditions which occur as a result of the immuno-compromised state of the patient being treated.

Inhibition of HIV-1 reverse transcriptase enzyme

- Using purified recombinant HIV-1 reverse transcriptase (RT, EC, 2.7.7.49) 25 obtained by expression in Escherichia Coli, a 96-well plate assay system is established for assaying a large number of samples using either the Poly(rA)-oligo(dT) Reverse Transcriptase [3H]-SPA enzyme assay system (Amersham NK9020) or the [3H]-flashplate enzyme assay system (NEN - SMP 103) and following the manufacturer's recommendations. The compounds are dissolved in 30 100% DMSO and diluted with the appropriate buffer to a 5% final DMSO concentration. The inhibitory activity is expressed in percent inhibition relative to DMSO control. Characteristic chemical shifts (δ) are given in parts-per-million downfield from tetramethylsilane using conventional abbreviations for designation of major peaks: e.g. s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; br, broad. The following abbreviations have been used: HRMS, high
